

- Prepruning and Postpruning are techniques used in decision trees to prevent overfitting by controlling their complexity.

I've Training dataset

In order to reduce overfitting :-

- Post Pruning →
- 1) Construct the DT
 - 2) Prune it with respect to depth
 - 3) Smaller datasets

Pre Pruning : Hyperparameter Tuning while constructing DT.

Sklearn

$\text{max_depth}=3$, $\text{max_feature}=\dots$
