

● Mean Squared Error, Mean Absolute Error, Root Mean Squared Error

(MSE, MAE, RMSE) [Cost function] → Performance Metrics

$R^2$  and Adjusted  $R^2$

⇒ Squaring  
Increase error  
penalizing  
Exp the outlier

MSE ↑↑

MSE

$$MSE = \frac{\sum_{i=1}^n (y - \hat{y})^2}{n} \Rightarrow \text{Cost function} \downarrow$$

Quadratic Equation

$$ax + by + c$$

$$(a-b)^2 = a^2 - 2ab + b^2$$

Convex function

- Advantage
- ① Differentiable ✓ at all point.
  - ② It has one local and one global Minima
  - ③ Converge faster

- Disadvantage
- ① Not Robust to outliers
  - ② It is not in same unit.

Non convex functions

$$MSE = \frac{1}{n} \sum_{i=1}^n (y_i - \hat{y}_i)^2$$

Salary (lakh)  
X Y  $(y_i - \hat{y}_i)^2$  (lakh)<sup>2</sup> (MSE)

$$\text{Error } 2.5 \Rightarrow (lakh)^2 \Leftarrow$$

② Mean Absolute Error (MAE)

$$MAE = \frac{1}{n} \sum_{i=1}^n |y - \hat{y}|$$

lakh

MAE ↑

### Advantage

- ① Robust to outliers ✓
- ② It will be in the same unit

### Disadvantage

- ④ Convergence usually take more time. Optimization is a complex task
- ⑤ Time consuming.

### ③ RMSE {Root Mean Squared Error}

MAE, MSE, RMSE

Performance metric ↑

$$\text{RMSE} = \sqrt{\text{MSE}}$$
$$= \sqrt{\frac{1}{n} \sum_{i=1}^n (y_i - \hat{y}_i)^2}$$

### Advantage

- ① Same unit
- ② Differentiable

### Disadvantage

- ④ Not Robust to outliers

MSE vs MAE vs RMSE }  
R^2 vs Adjusted R^2 }
